LAB OVERVIEW

This lab teaches you how to create an embedded system implemented in programmable logic using the Intel® Nios II processor, sometimes referred to as a “soft” processor. The Nios II can be synthesized on any Intel® FPGA device, and has a built in programmable logic fabric that can be easily modified to suit an applications' requirements. Intel® SoC FPGA devices contain a processor built from standard cells that cannot be changed without redesigning the chip, and are therefore called a textithard processor system. The Nios II processor is supported by a rich set of peripherals and intellectual property (IP) blocks built that can be configured and connected to the processor using the Platform Designer tool within the Intel® Quartus Prime software suite. Intel also distributes the Nios II Software Build Tools (SBT) within the Quartus download to use with Eclipse* during software development.

This lab is organized to run on a number of Intel® FPGA development kits. The links to the other kits' Design Examples can be found in the [Design Store](#) by typing “hello” in the search bar. This lab will show you how to install the development kit pin settings, design the processor-based hardware system, download it to the development kit, and run a simple “Hello World” software program which displays the text on your terminal. The initial section of the lab is split into a hardware section and a software section.

LABNOTES

IMPORTANT: PLEASE READ AND FOLLOW THESE GUIDELINES THROUGHOUT THE LAB OR THE LAB WILL NOT WORK!

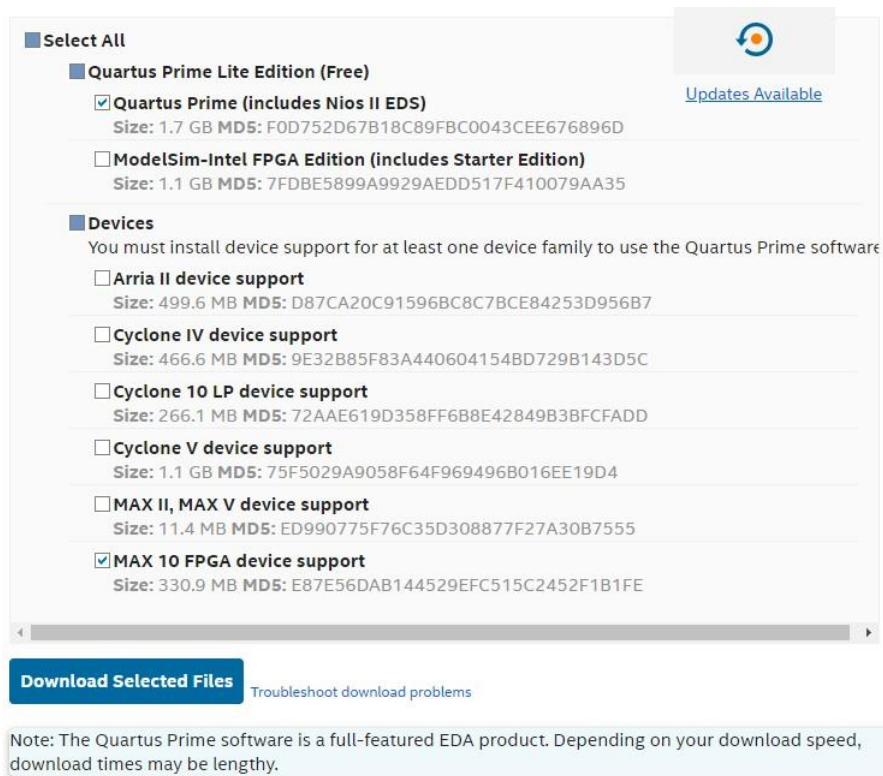

- *The lab will require you to choose files, components, and other objects. **They must be spelled exactly as directed.***
- **DO NOT USE SPACES IN THE FILE NAMES OR DIRECTORIES.**
- *This is necessary for consistency and to ensure that each step works properly in the lab, when creating your own systems, you can choose your own names if you use them consistently in your project.*

Quartus Prime is Intel FPGA's design tool suite. It serves a number of functions:

- Design creation through the use of HDL or schematics
- System creation through the Platform Designer graphical interface
- Generation and editing of constraints (timing, pin locations, physical location on die, I/O voltage levels)
- Synthesis of high level language into an FPGA netlist, formally known as mapping
- FPGA place and route, formally known as fitting
- Generation of design image used to program an FPGA, formally known as assembly
- Timing Analysis
- Download of design image into FPGA hardware, formally known as programming
- Debugging by insertion of debug logic (in-chip logic analyzer)
- Interfacing to third party tools such as simulators
- Launching of Software Build Tools (Eclipse) for Nios II

To download Quartus Prime Lite, follow these instructions:

- ☐ Visit this site: <https://fpgasoftware.intel.com/?edition=lite>.
- ☐ Select version 18.1 and your PC's operating system.
- ☐ For the smallest installation and quickest download time, select only the fields shown on the following page in Figure 1. Under Quartus Prime Lite Edition, select only the Quartus Prime, uncheck ModelSim. Under devices select **MAX 10 FPGA device support**. Uncheck the rest.

The screenshot shows the Quartus Download Page with the following content:

- Select All** (button)
- Quartus Prime Lite Edition (Free)**
 - ☒ **Quartus Prime (includes Nios II EDS)**
 - Size: 1.7 GB MD5: F0D752D67B18C89FBC0043CEE676896D
 - ☐ **ModelSim-Intel FPGA Edition (includes Starter Edition)**
 - Size: 1.1 GB MD5: 7FDBE5899A9929AEDD517F410079AA35
- Devices**

You must install device support for at least one device family to use the Quartus Prime software

 - ☐ **Arria II device support**
 - Size: 499.6 MB MD5: D87CA20C91596BC8C7BCE84253D956B7
 - ☐ **Cyclone IV device support**

Download Selected Files (button) [Troubleshoot download problems](#)

Note: The Quartus Prime software is a full-featured EDA product. Depending on your download speed, download times may be lengthy.

Figure 1: Quartus Download Page

- ☐ Follow the instructions to activate the Quartus Prime Lite version 18.1 tools on your PC. No license is required to run the Quartus Lite software.

DESIGN FLOW

Unlike system development with hard processors, development with soft processors enables you to optimize the processor system to your application requirements and use the FPGA to add the performance and interfaces required by your system. This means that you need to know how to modify the processor system hardware; this may sound challenging but thanks to the Platform Designer graphical system design tool this is a relatively easy thing to do as we will demonstrate in this lab.

The design flow diagram below illustrates how an overall system is integrated using the combination of the Platform Designer system integration tool, Quartus for mapping (aka synthesis), fitting (aka place and route), and the NIOS II Software Build Tool (SBT) for software development.

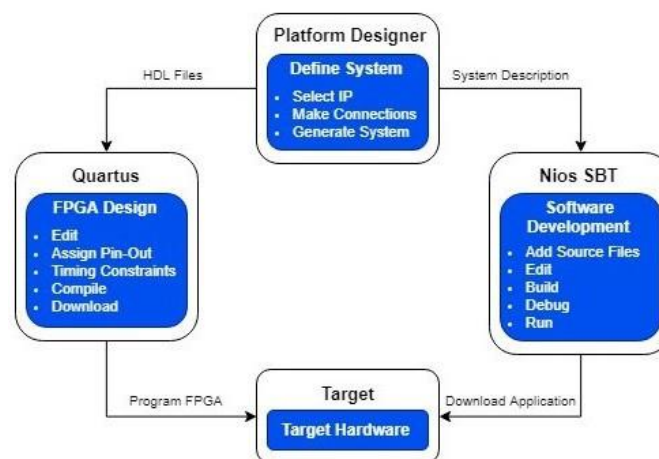

Figure 2: Platform Designer Development Flow

The above diagram depicts the typical flow for Nios II system design. Hardware System definition is performed using Platform Designer tool; the resultant HDL (.Qsys) files from the Platform Designer system are used by the Quartus design software to map, fit and download the hardware image into the FPGA device. Quartus also generates information that describes the configuration of the system designed in Platform Designer so that the Nios II SBT can be configured to create a software library that matches the hardware system and contains all the correct peripheral drivers.

OBJECTIVE OF THE "HELLOWORLD" LAB

This lab demonstrates how to use Platform Designer tool to design the hardware and software to print "Hello World" to your screen. This requires a working processor to execute the code, on-chip memory to store the software executable, and a JTAG UART peripheral to send the "Hello World" text to a terminal. To make the lab a little bit more interesting and hardware-centric, we will utilize the push button switches and LEDs to allow interaction with the development kit. We will use connections to memory that the processor can access to map the various switches and buttons on the device to the LEDs and seven-segment display.

The lab hardware is constructed with the components shown below. Intel utilizes the Platform Designer network-on-chip interconnect to connect the master and slave devices together. In the interest of time, you are given a nearly completed NIOS II based system to start. The started file project will omit the JTAG UART which provides connectivity to the keyboard and display. You will be given detailed instructions on how to connect the JTAG UART to the Avalon bus.

Figure 3: Nios II Based System Used In This Lab

GET STARTED WITH QUARTUS

This lab demonstrates how to use Platform Designer tool to design the hardware and software to print “Hello World” to your screen. This requires a working processor to execute the code. Follow the instructions below to start performing the lab.

- Get the associated .zip folder from the design files you downloaded for this lab. The file, **DE10_Lite_qsys_workshop_semicomplete.zip** will contain the semi-completed project.

Figure 4: DE-10 Lite

Board	Files
DE-10 Lite	DE10_Lite_qsys_workshop_semicomplete.zip

Table 1: Resource File

- Unzip the .zip file. Right click on the .zip folder and select **Extract All...** Browse to the directory you want your unzipped files to go and press Enter. Within the file there are two items: C_CODE and DE10_Lite_semicomplete.qar. **The lab will not work if you do not unzip the files!**
- Double click on the (.qar) file.  If you have Quartus completely installed, the Quartus software should open the (.qar) file. (.qar) stands for **Quartus Archive File** and allows a user to store a project and its related files in a single archive and then restore the project later. This is done for your convenience and to make the overall lab time shorter.
- Select a destination folder where you want your project to be restored, by clicking on ... near the destination folder. *Make sure your destination folder is a C:// drive folder where your installed Quartus or your documents location where you want your project to be and contains no spaces.* Select **OK** for the first screen that appears when the

(.qar) file opens.

Figure 5: Selecting Archive Name and Destination Folder for the .qar file.

Once the (.qar) is done unpacking all its files, you will be able to navigate around the main Quartus window. We will start modifying our system by using Platform Designer.

PART 1: HARDWARE DESIGN

Lab 1: Building Your Platform Designer Based Processor System

The Platform Designer system panel diagram illustrates what you are designing in the Platform Designer environment. The system we are building will have a clock, a single master (the Nios II processor), and 11 slave devices.

Building the Platform Designer system is a highly efficient way of designing systems with or without a processor.

- ❑ Launch Platform Designer tool from Quartus: **Tools** → **Platform Designer**. A pop-up should open asking if you would like to open a system file. If no pop-up is displayed, click **File** → **Open**. Open the file **nios_setup_v2.qsys**. Most of the design was completed beforehand, and almost all the components will already be placed for you. The initial screen you should see looks like this:

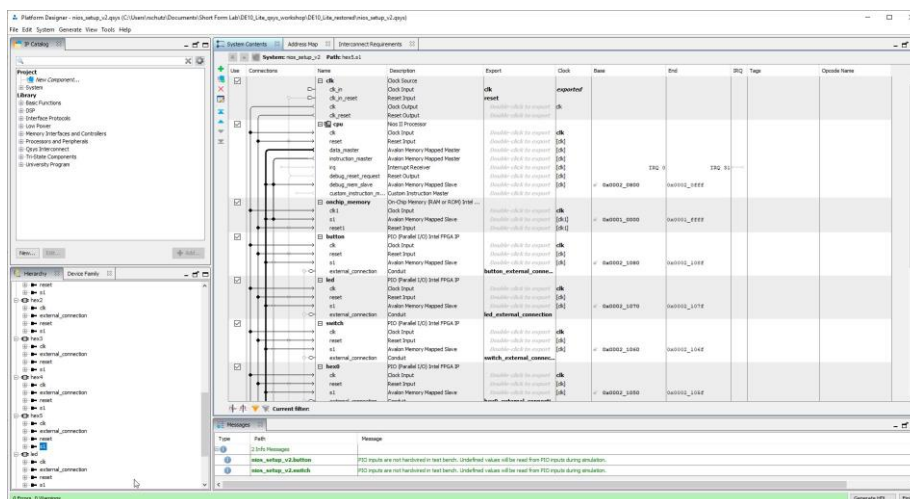

Figure 6: Platform Designer Main Panel

Next we will add the last remaining component: the JTAG UART.

1.1 : Adding the JTAG UART Component

The only component you will add to this semi-completed project is the JTAG UART. To add this last component to the system, look for the IP catalog tab in the top left of the Platform Designer window. Below the IP catalog tab, you can search for the JTAG UART component you want to add to your system.

- ❑ Search for **JTAG** in the IP catalog and locate the **JTAG UART**. Double click or click **Add**.
- ❑ Keep the default settings and click **Finish**.
- ❑ Rename the JTAG UART by right-clicking, pressing rename, and renaming to **jtag_uart**.

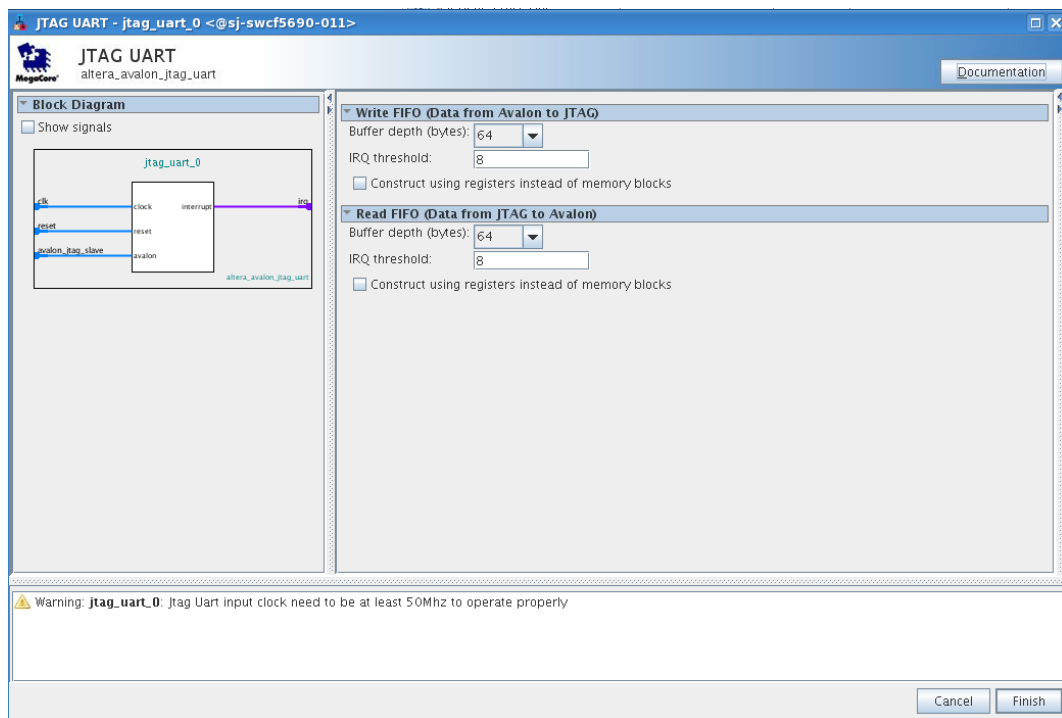

Figure 7: JTAG UART Configuration Panel

1.2 : Connecting the System Components Together

The next step consists of making the appropriate connections between the components and the JTAG UART component within Platform Designer.

- Highlight the clock output coming into the clk pin on the JTAG UART component. When first selected, it will be a gray color.
- Make the connection between the clk component's output and the JTAG UART's clock input by clicking on the small circle on the line that intersects with the component. Do the same for the reset signal of the JTAG UART component and the reset signal from the clk.

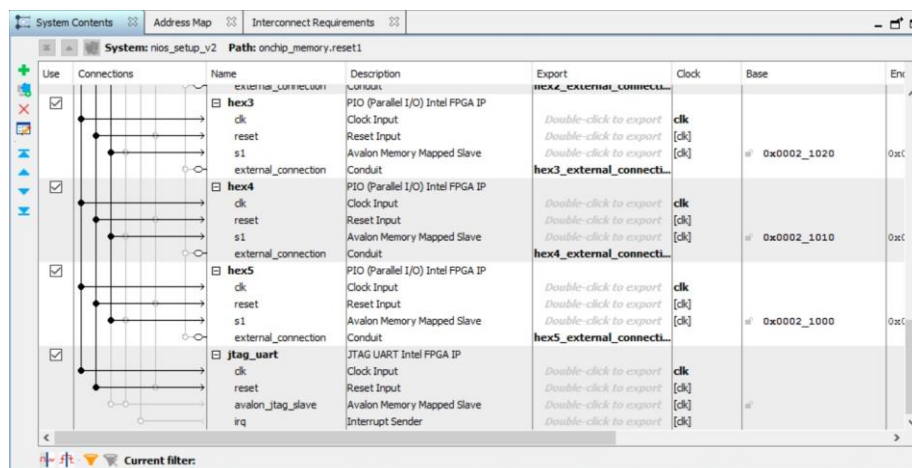

Figure 8: JTAG UART Connections

- The next connections to make are the processor interrupt request (IRQ) signals. Make this connection by clicking on the empty bubble. We will use the default setting for the IRQ number. The UART can drive interrupts, and hence needs to be wired to the cpu processor interrupt lines.
- Last you need to connect the **avalon_jtag_slave** with the **data master** connection coming out of the cpu.
- Your final connections should look like the following figure.

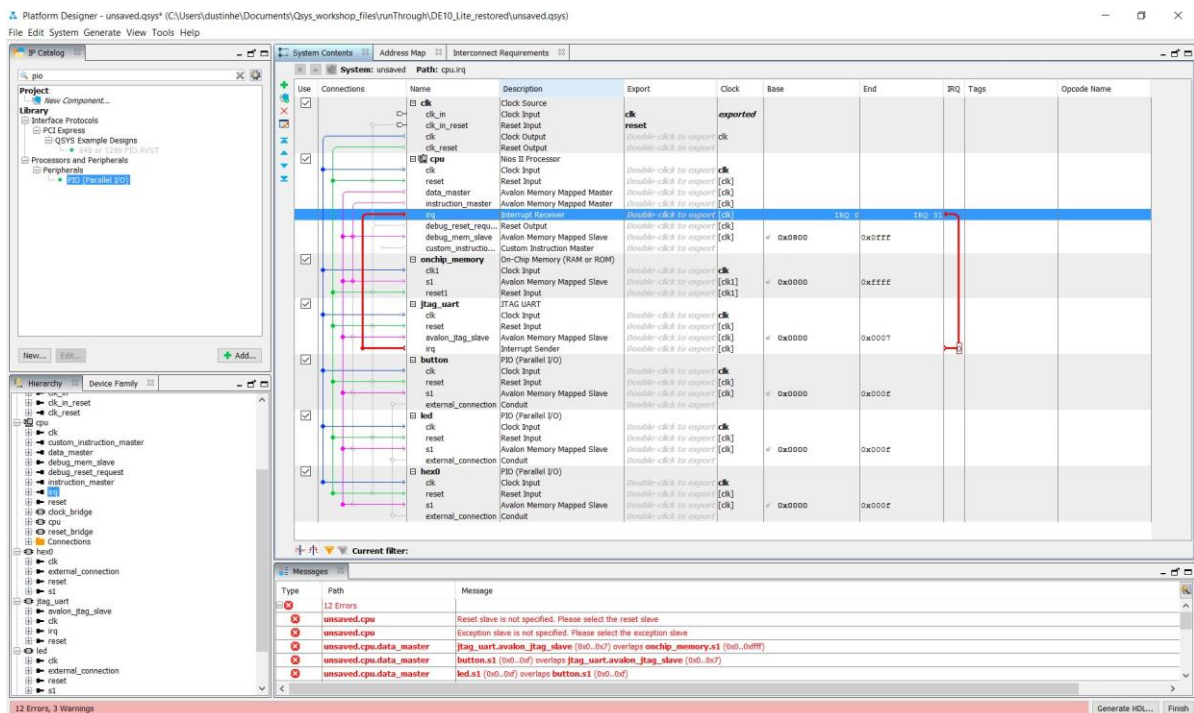

Figure 9: System Contents After Interrupt Connections

- Next you will need to generate the base addresses for your Platform Designer system. This is achieved by clicking on **System** → **Assign Base Addresses**.
- Save your Platform Designer system by using **File** → **Save**. The information is saved in a .qsys file. Note that by saving, you still have not generated the files that you need for Quartus compilation or with the Eclipse SBT.
- Click on the button **Generate HDL**. A screen like Figure 10 should appear.
- Click **Generate** on the panel that appears.
- When the file generation is complete, click **Finish** to exit the Platform Designer window.

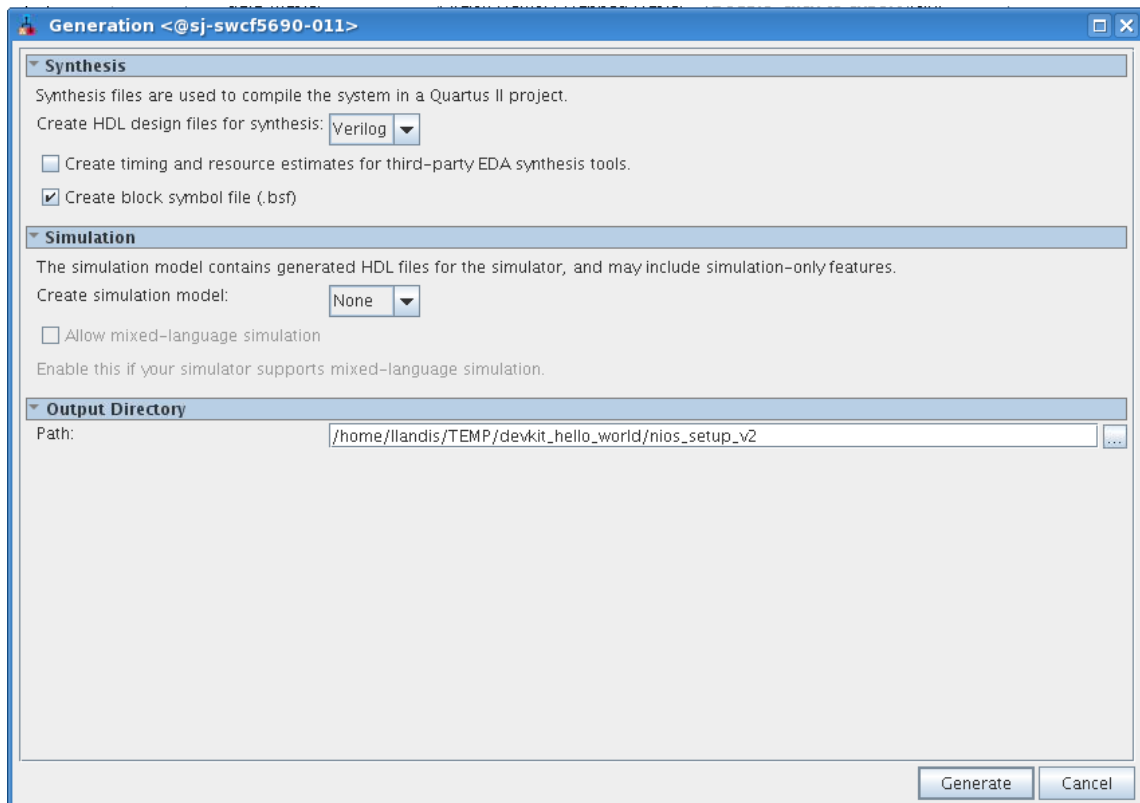

Figure 10: HDL Generation Panel

Congratulations! This completes the Platform Designer section of the lab.

Lab 2: Building the Top Level Design

The next step is binding together your Platform Designer system with Verilog code.

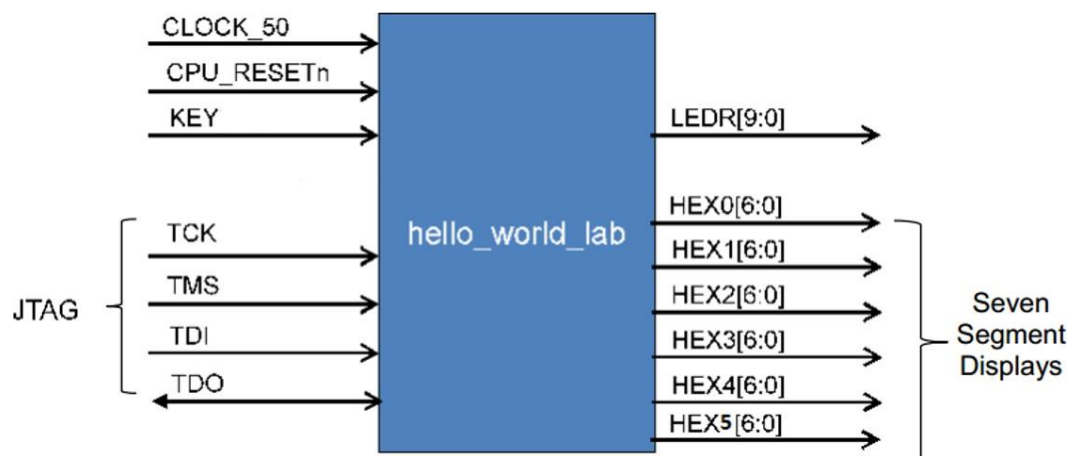

Figure 11: Block Diagram of hello_world_lab Design

Quartus should be open. Bring that to the front of your screen. Note that for this design there is a clock, reset, push button inputs, switch inputs, LED outputs, six HEX outputs (the seven-

segment displays), and a JTAG UART. The JTAG UART pins are hard wired into the FPGA so you don't need to add them in your Verilog source file. The 4 pins: TCLK, TDI, TMS and TDO that constitute a 4 wire JTAG interface are at a fixed location in your FPGA and they don't need to be added to your Verilog source file. Only pins that are synthesized from your RTL source code need to be specified.

- The top-level entity is in a file called **DE10_LITE_Golden_Top**.

Golden top is a naming convention that Intel FPGA often uses to designate the connections between the FPGA and all of the external components on the development board. This file is generally provided by the manufacturer of the development board, but we provide this code as part of the Quartus Archive (.qar) file for this course. You can see it by double clicking on file under the Project Navigator section.

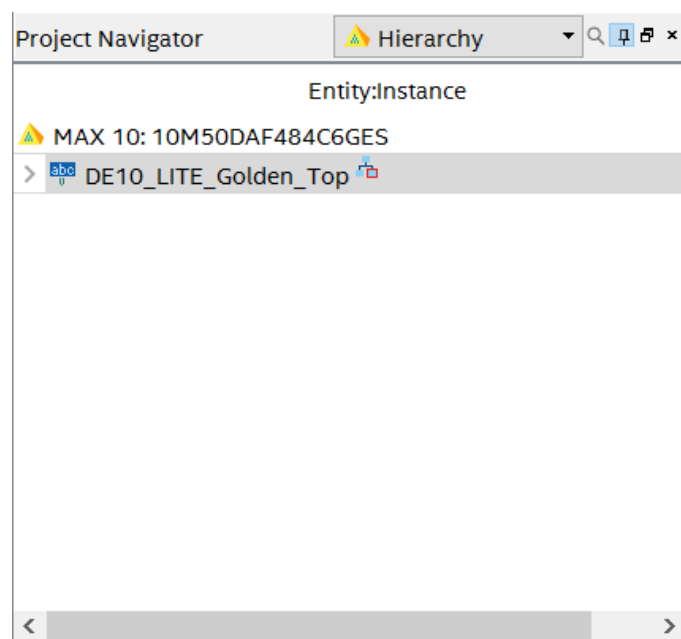

Figure 12: Project Navigator View of Golden Top File

The code connects the pushbutton inputs to the LED outputs in software. Keep in mind that the clock, reset, push button, and LED pin names need to reflect the names for the Development Kit.

If you were wondering how to hook up the `nios_setup_v2` module yourself, you can check **`nios_setup_v2_inst.v`**, which was auto-generated from **`nios_setup_v2.qsys`** inside the `nios_setup_v2` directory of your project. Open this file and you see how to instantiate the Platform Designer system. The contents of this file are shown in Figure 13.

```

nios_setup_v2 u0 (
    .clk_clk (MAX10_CLK1_50), //clk.clk
    .led_external_connection_export (ledFromNios[9:0]), //led_external_connection.export //CHANGED TO LEDR
    .reset_reset_n (1'b1), //reset.reset_n
    .button_external_connection_export (KEY[1:0]), //button_external_connection.export
    .switch_external_connection_export (SW[9:0]), //switch_external_connection.export
    .hex0_external_connection_export (HEX0), //hex0_external_connection.export
    .hex1_external_connection_export (HEX1), //hex1_external_connection.export
    .hex2_external_connection_export (HEX2), //hex2_external_connection.export
    .hex3_external_connection_export (HEX3), //hex3_external_connection.export
    .hex4_external_connection_export (HEX4), //hex4_external_connection.export
    .hex5_external_connection_export (HEX5) //hex5_external_connection.export
);

//Uncomment the line below by deleting the "//"
assign LEDR[2] = SW[2];

//ignore what is below here

wire [9:0] ledFromNios;
assign LEDR[1:0] = ledFromNios[1:0];
assign LEDR[9:3] = ledFromNios[9:3];
assign HEX0[7] = 1'b1;
assign HEX1[7] = 1'b1;
assign HEX2[7] = 1'b1;
assign HEX3[7] = 1'b1;
assign HEX4[7] = 1'b1;
assign HEX5[7] = 1'b1;
endmodule

```

Figure 13: Contents of nios_setup_v2_inst.v

We need to specify the top-level entity of our project and add the Verilog code generated by the Platform Designer system we just created to the project.

- In the top file (DE10_LITE_Golden_Top.v) **uncomment line 88** by deleting the “//” at the beginning of the line.
 - By uncommenting this line, we directly drive LED 2 on the board with switch 2 through the FPGA hardware. No software is required for this LED to operate.
- In the Quartus main window, go to **Project** → **Add/Remove Files**.
- Add the **nios_setup_v2.qip** file. (You can also just add the nios_setup_v2.qsys file.)
 - The nios_setup_v2.qip file should be found under **nios_setup_v2** → **Synthesis** directory in your project.
 - You will need to change the filter to display **All files** if you cannot see it.

The **.qip** file contains the information for the processor system that we created in the last step. The **.v** file connects the Platform Designer system we made to the inputs and outputs of our board.

- Click **Apply** once you have added the file.

See Figure 14 for what your Add/Remove Files window should look like. (There may be an extra .sdc file in the list. This is fine.)

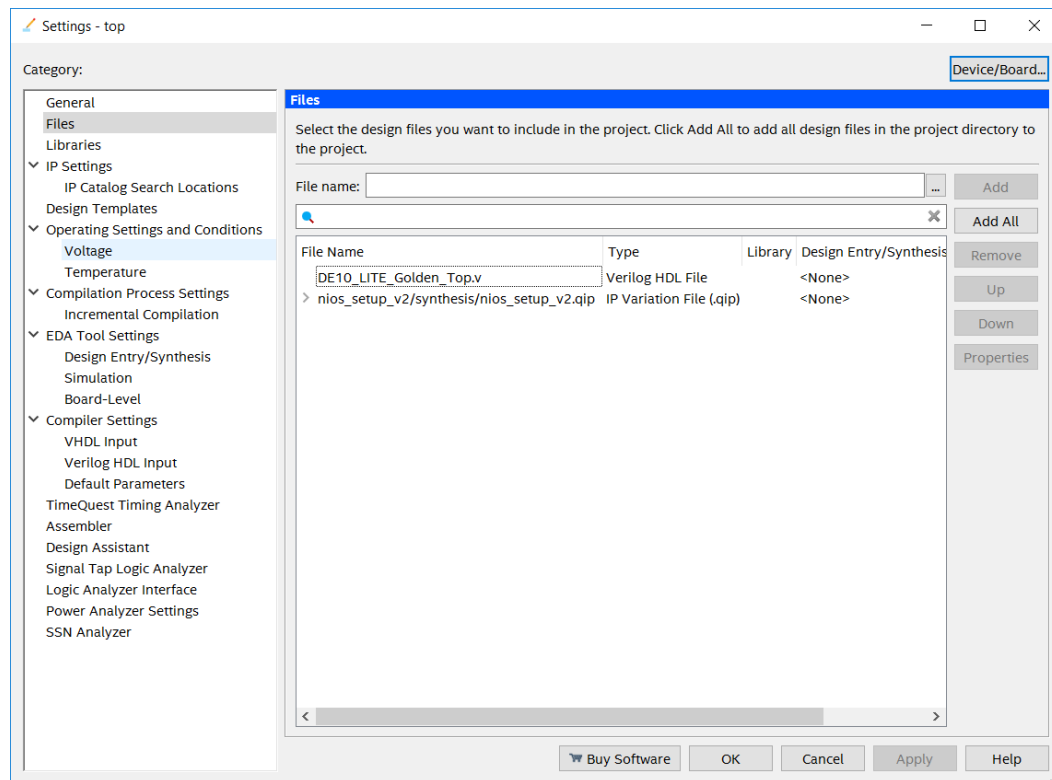

Figure 14: Quartus Add/Remove Files Pane

Almost there! We have pre-included and set up the pin assignments for the development kit for you so you do not have to manually set dozens of pins using the pin planner. These commands handle routing the pins and voltage levels so they can be easily transferred between projects that use the same board.

- To view the pin assignments, go to **Assignments** → **Assignment Editor**.

Figure 15: Quartus Assignment Editor Window

Figure 15 above is what the **Assignment Editor** window should look like. After compiling your design, the blue diamonds with question marks inside should change to show whether those pins are inputs or outputs.

Now you can compile your design which will run Analysis/Synthesis, Fitter (place and route in FPGA terminology), Assembler (generate programming image) and TimeQuest (the static timing analyzer).

- Click on the play button as shown in Figure 16.

Figure 16: Compilation Button on Quartus Toolbar

Note that some warnings and information messages come up in the bottom window. You can filter by message level. The errors are filtered with the  button, critical warnings with the  button, warnings with the  button, and informational messages with the  button. You cannot proceed if you have errors. In this case, there are only critical and standard warnings, primarily because we did not add timing constraints to this project. Due to the simplicity of this design and low frequency, it's okay to start without timing constraints. Consult other Intel FPGA online training courses for instructions on how to add timing constraints to your design.

Congratulations, your FPGA hardware design is now complete!

Now we will create software that will run on the board and take advantage of the Nios II processor that we just configured.

PART 2: SOFTWARE DESIGN

Lab 1: Creating the Software for the “Hello World” design

Should you choose to start directly in the Software Design section and skip the Hardware Design section, consult with your lab facilitator to get these two files: **nios_setup_v2.sopcinfo** and **top.sof** as if you generated them from the Hardware Design lab. You will be able to complete all subsequent steps with these two files.

The NIOS Software Build Tools for Eclipse are included as part of Quartus. These tools will help manage creation of the application software and Board Support Package (BSP).

- Launch **Tools** → **NIOS II Software Build Tools** for Eclipse. You can use the default location that Eclipse picks for you.

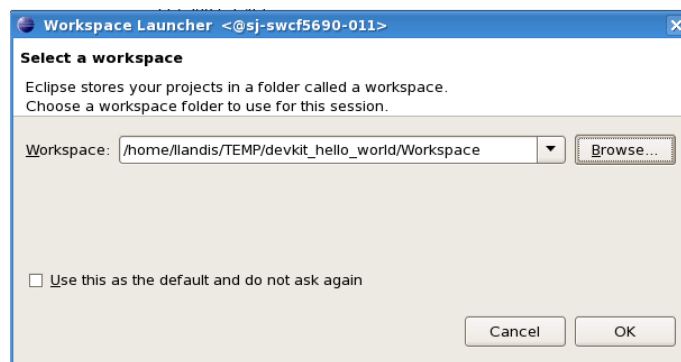

Figure 17: Initial Workspace Setup

- Click **OK** in the Workspace launcher. Next, the Eclipse SBT will launch.

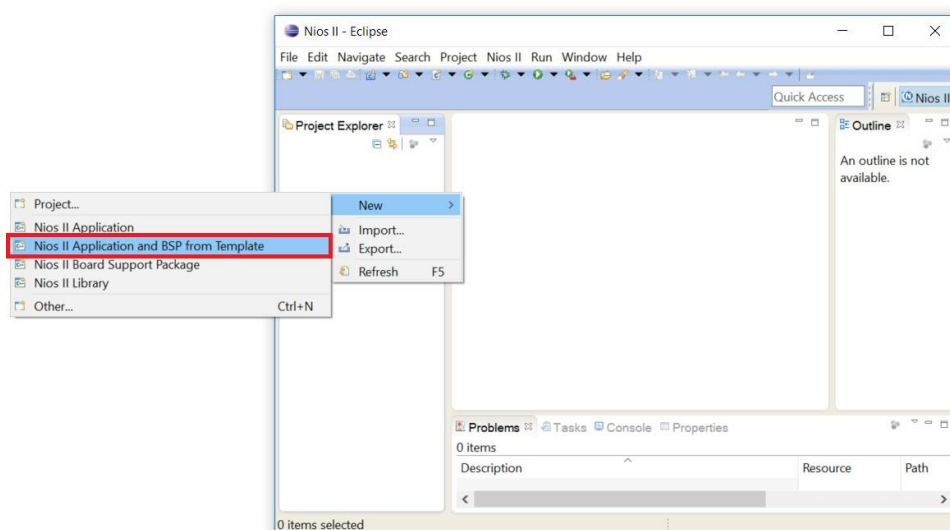

Figure 18: Creating the Initial Project in the Eclipse SBT

- Right click in the area called Project Explorer and select **New** → **Nios II Application and BSP from Template** as shown in Figure 18 above.

The BSP is the “Board Support Package” that contains the drivers for things like translating printf C commands to the appropriate instructions to write to the terminal.

Next you will see a panel that requests information to setup your design.

- Navigate to your working directory and click on the **.sopcinfo** file. The **.sopcinfo** file informs Eclipse on what your Platform Designer system contains.
- Click **OK**.

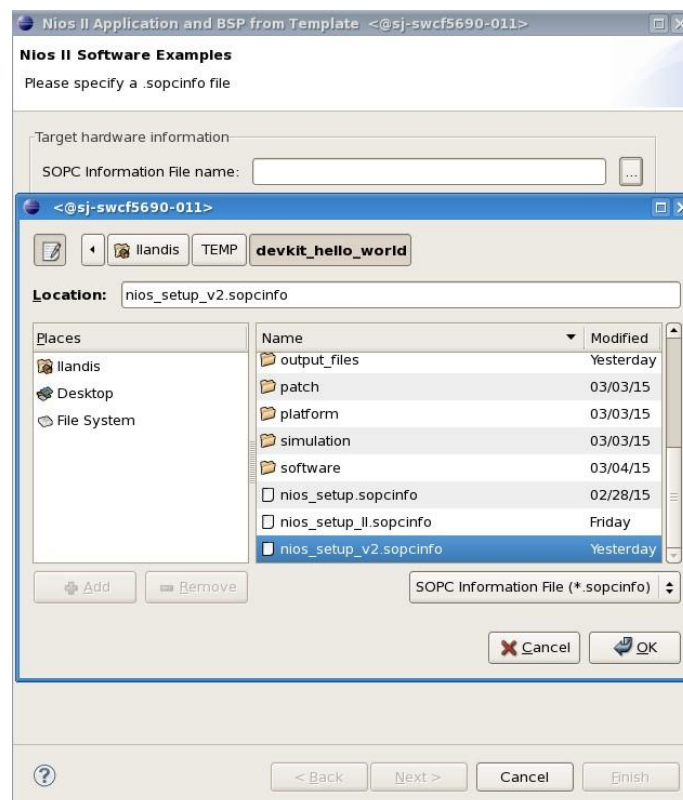

Figure 19: Navigating to the .sopcinfo File

- Fill in the Project name, call it **hello_world_sw**.
- Next you will be asked to pick a template design. Select the **Hello World Small**” application template. This template writes “Hello from Nios II” to the screen.
 - Make sure to pick Hello World Small and not Hello World or you will not have enough memory in your FPGA design to store the program executable.
- Click **Finish**.

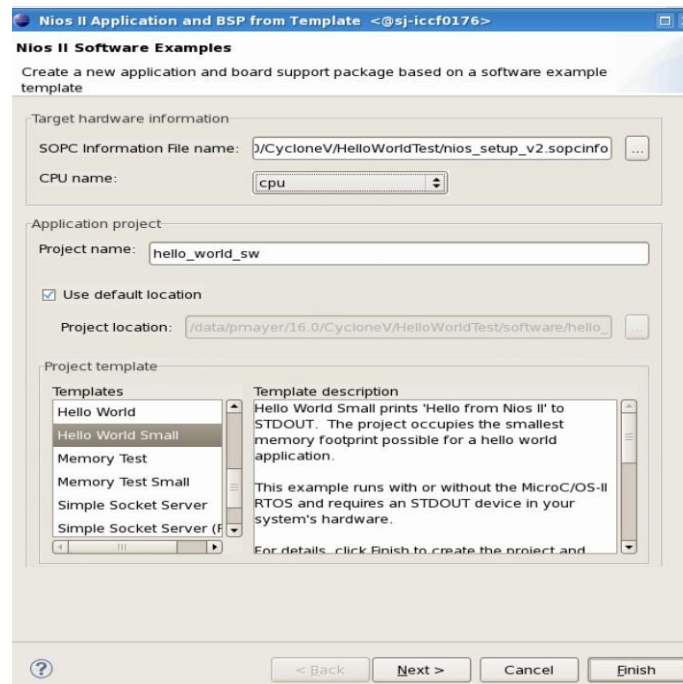

Figure 20: Completing the Nios II Software Examples Setup Screen

We will now make some modifications to the code to display the results of the pushbuttons (KEY1-0) on LEDs 3-2.

- Click the right arrow next to `hello_world_sw`. It will show the contents of your project. Double-click **`hello_world_small.c`**.

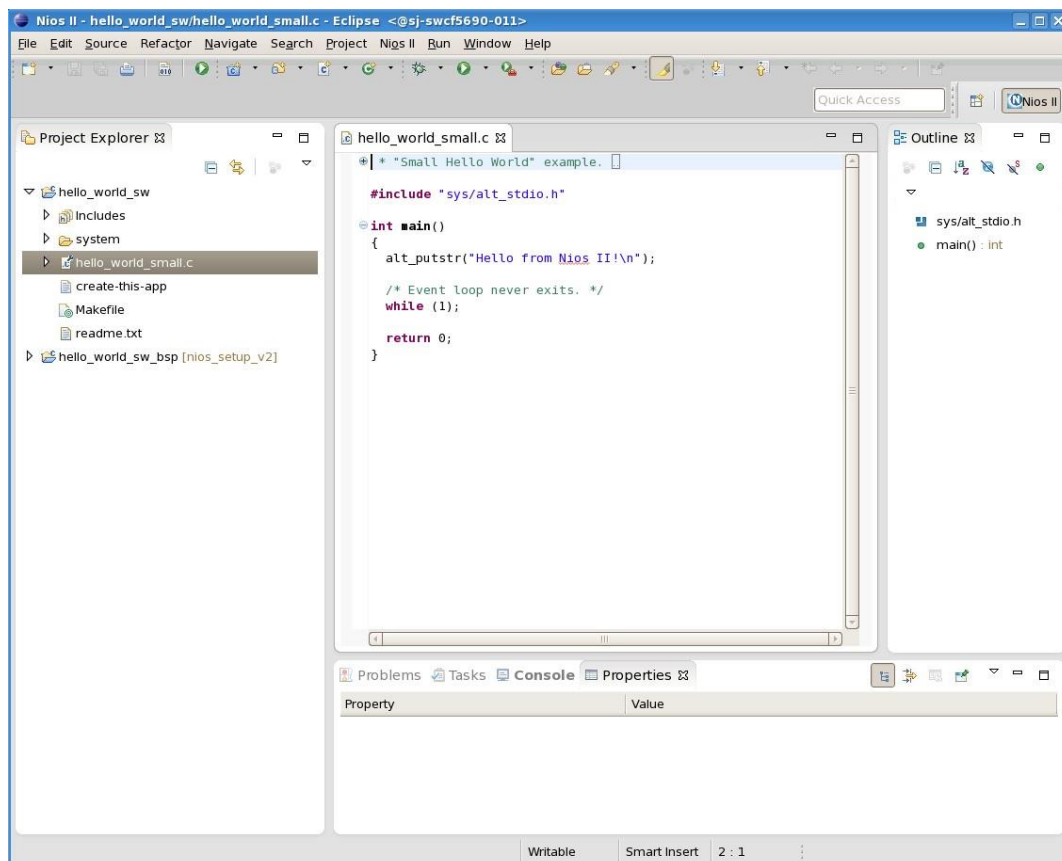

Figure 21: Eclipse Window of “hello_world_small.c”

Note the command `alt_putstr` to write text to the terminal. This is part of the Hardware Abstraction Layer (HAL) set of software functions. Note that the `alt_putstr` command is used versus a standard C `printf` function because the code space is more compact using the HAL commands. Code using HAL functions without an operating system is referred to as “bare metal” programming. A complete list of these functions can be found in the Nios II Software Developer’s Handbook: <https://www.intel.com/content/www/us/en/programmable/products/processors/support.html>.

Next you need to add a library declaration, define integer `switch_datain`, and a few HAL functions to connect the LEDs to the Push Buttons.

- ❑ Drag and drop the file **DE_hello_world.c** (found in the subfolder `C_CODE`) into Eclipse Project Explorer tab under the **hello_world_small_sw** project folder.
 - If you cannot drag and drop, copy and replace the code from the `DE_hello_world.c` into the `hello_world_small.c` and skip the next step.
- ❑ Delete the pre-made **hello_world_small.c** file in your **hello_world_sw** folder in the Eclipse Project Explorer. This can be done by right clicking on **hello_world_small.c** and selecting **Delete** from the drop down menu that appears.

The code may appear somewhat cryptic, so we will now take the time to explain what the various lines do. `IORD_INTELPSG_AVALON_PIO_DATA(Location)` gets the data from the specified Location (given in the `system.h` file under the `hello_world_sw_bsp` folder) and reads it into a variable. Calling the function with two parameters, as in: `IOWR_INTELPSG_AVALON_PIO_DATA(Location, Value)` writes the numeric Value to the given Location. We are using this function to read the data from the push buttons and then write this value to LEDs.

Note the use of the variables `BUTTON_BASE` and `LED_BASE`. These variables are created by importing the information from the `.sopcinfo` file. You can find defined variables in the `system.h` file under the `hello_world_sw_bsp` project. Double click on `system.h` file and inspect the defined variable names for `BUTTON_BASE` and `LED_BASE`. These must match your `hello_world_small.c` code.

- ❑ Click the save icon.
- ❑ Now that we have written our code, click **Project** → **Build All**.
- ❑ Once the build completes, you should observe an **.elf** file (executable load file) under the **hello_world_sw** project. If the **.elf** file does not exist, the project did not build properly. Inspect the problems tab on the bottom of the Eclipse SBT and determine if there are syntax problems, correct, and rerun **Build All**. Typical problems include missing semi-colons and mismatched brackets.

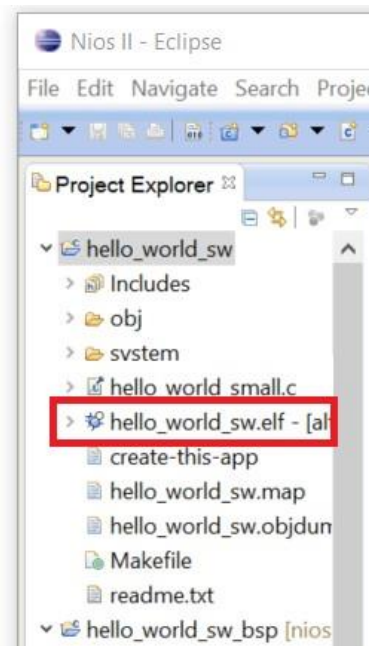

Figure 22: Window View of “hello_world_sw.elf”

Lab 2: Downloading the Hardware Image to the Development Kit

If you have never used the USB blaster before, you will need to follow these steps to update your USB blaster's driver software. If you have used the USB blaster before on your computer, you may skip this portion of the manual.

To work with the Max10 in the context of this lab, you will need to connect a USB cable connecting the kit to a host PC. The USB blaster utilizes circuitry that formats the image into a data stream that downloads from the PC to FPGA.

To install the USB Blaster, follow these steps:

- ☐ To begin, make sure you connect your board to your computer via a USB cable. Depending on your board model, you may need to plug your board into power.
- ☐ Hit the windows key  and type **Device Manager**.
- ☐ Click on the Device Manager tile that appears.
- ☐ Navigate to the **Other Devices** section of the device manager and expand the section.

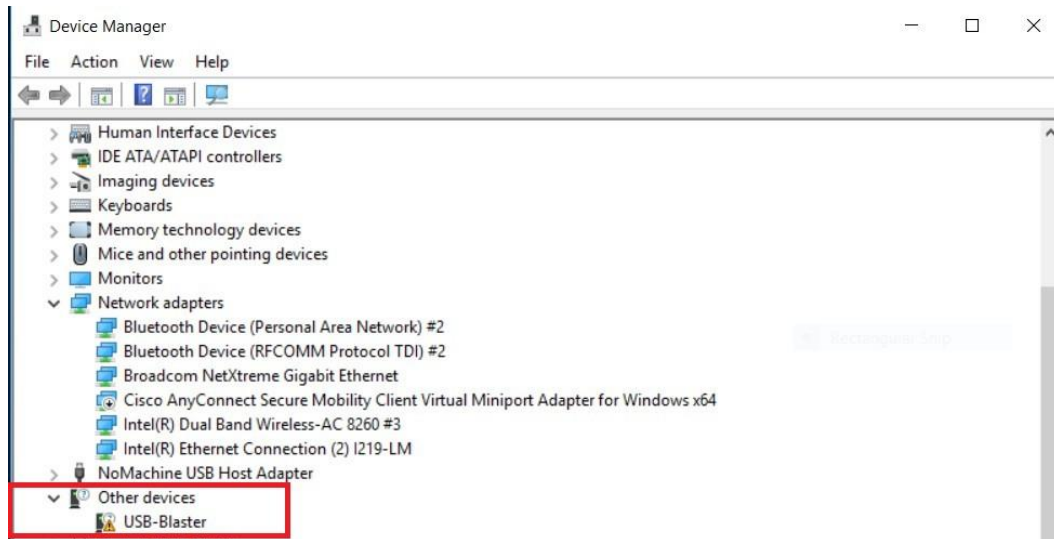

Figure 23: Device Manager Showing USB Blaster Drivers Not Installed

- ❑ Right click the USB-Blaster device and select **Update Driver Software**".
- ❑ Choose to browse your computer for driver software.

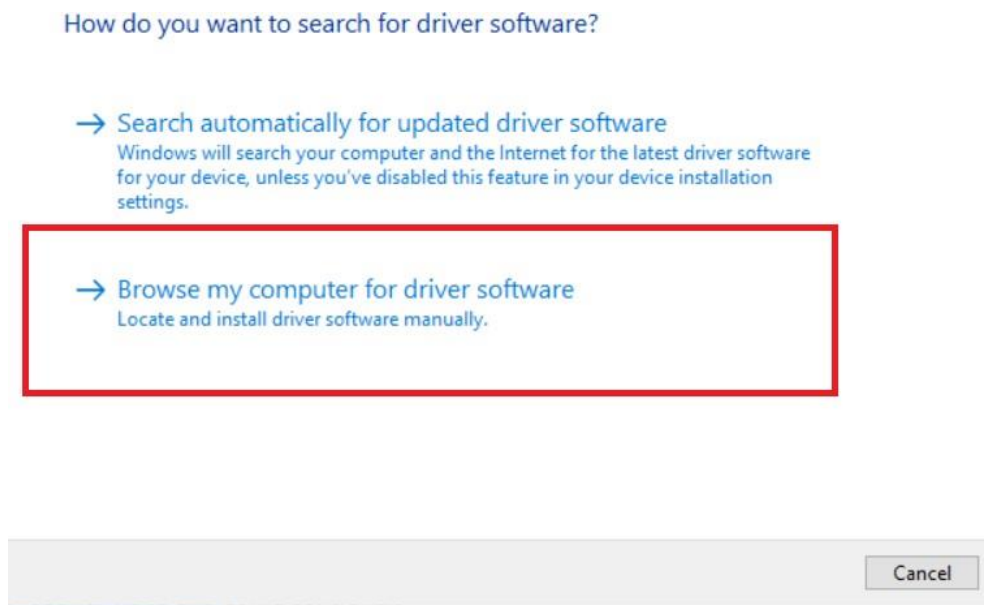

Figure 24: Selecting to Browse for Driver Software Directory

- ❑ Navigate to the path shown in Figure 24. This should be the path where you have installed Quartus on your computer.

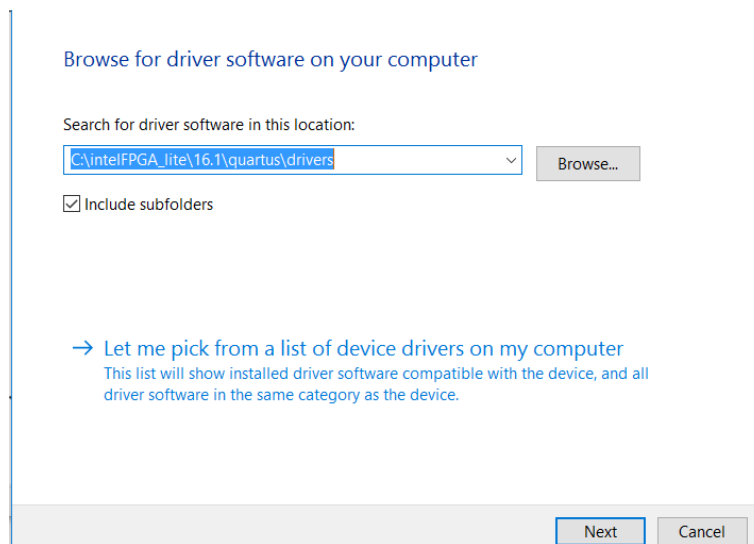

Figure 25: Directory Containing USB Blaster Drivers

- ❑ Once you have the proper file path selected, click on **Next** and the driver for the USB Blaster should be installed.
- ❑ With the USB blaster drivers properly installed, launch the Programmer by clicking **Tools** → **Programmer**.
- ❑ Next, you need to download what is called a **.sof** file or SRAM object file. This is the programming image file that gets downloaded in the FPGA. The default location is <working_directory>/output_files.
- ❑ Right click on the first row <none> under File and click on **Change File**. Navigate to the output_files directory and select **top.sof**.
- ❑ Click **Open**.

Figure 26: Program/Configure Checkbox

- ❑ In the first row under **Program/Configure** click in the check box as shown in Figure 26 above.
- ❑ Click on **Hardware Setup**, located in the top left corner of the programmer window. In the currently selected hardware section, click on the drop-down menu and select the **USB Blaster**.

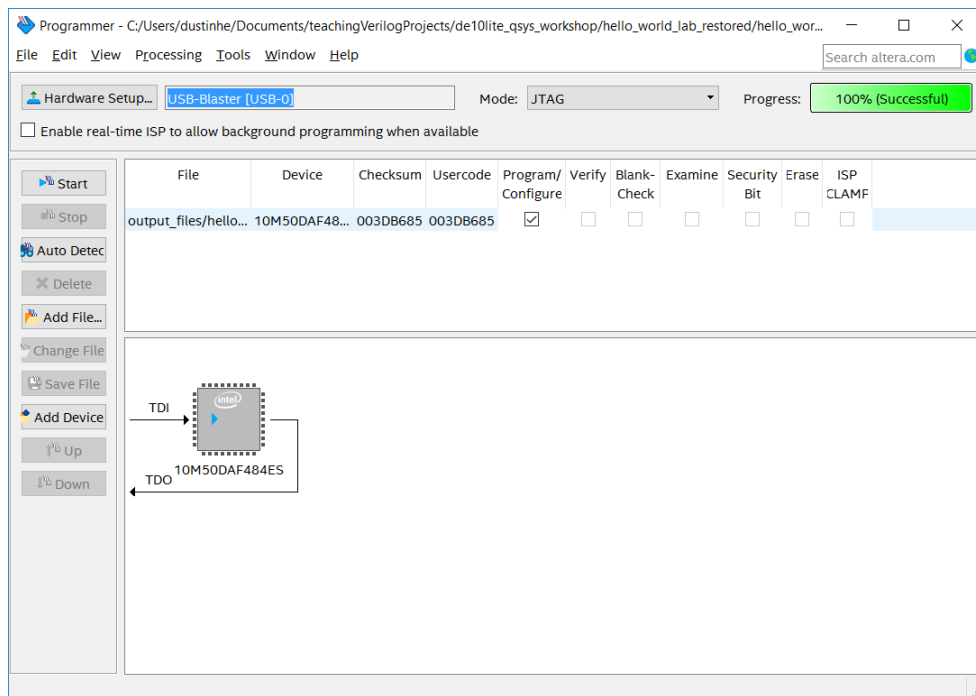

Figure 27: Programmer Progress Successful

- ❑ Click **Start**, located on the left of the programmer window. When programming is complete, the progress meter should read 100% (Successful).

Now that the FPGA is programmed the hardware is operating. However, we have not programmed the software for the NIOS CPU yet. To demonstrate the hardware is functioning, even while the NIOS processor is not, press the switch SW2 to on (towards the LEDs). You should see only one LED light up. Follow the steps below then try pressing the keys again. Note how the hardware driven LED does not need the software executable file .elf to operate.

Now it is time to download the .elf (software executable) into the Nios II processor.

- ❑ Return to the Eclipse SBT tools. Right click on **hello_world_sw** and select **Run as** → **Run Nios II Hardware**. A window should appear as shown below.
- ❑ Click on the **Target Connection** tab.
 - The connection should indicate that Eclipse has connected to the USB-blasters.
 - If the connection is not identified, you can click **Refresh Connections**.
 - You might need to stretch the window wider to see the Refresh Connections button.
- ❑ Once the connection is made to the USB-Blaster, you should observe something like Figure 28.
- ❑ Click **Run**. If the run button is grayed out but your device shows up under the connections window, you may need to select **Ignore mismatched system ID** and **Ignore mismatched system timestamp**.

Figure 28: Eclipse SBT Tools after Connection is made to the USB-Blaster

- Now you have hardware and software downloaded into your board. You should observe “Hello from Nios II!” printed on the Nios II Console tab.

Figure 29: “Hello from Nios II!” on Nios II Console Tab

- You can also test the connections between push button and LEDs. Push buttons 0-1 should now turn LEDs 0-1 on when pressed. The pushbuttons and LEDs were connected through our Platform Designer system and the C code we have running on our development kit.

KEY CONCEPTS:

- When you push buttons 0 and 1, LEDs 0 and 1 will light up. This connectivity is made through **software**.
- When you flick switch SW2, LED 2 will light up. This connectivity is made through **hardware**.

Lab 3: Using the Seven Segment Display

One of the nice things about the NiosII processor is that since we have already designed the hardware, we can now change the software without having to reprogram the FPGA. We will

now program the NiosII processor to display text on the seven segment displays and make pushbuttons speed up and slow down the text.

- ❑ Drag and drop the file named **DE_seven_segment_display.c** into the hello_world_sw project folder in Eclipse. DE_seven_segment_display.c can be found in the C_CODE subfolder in the DE10_qsys_workshop folder. **If you cannot drag and drop the file, copy and replace the code from DE_seven_segment_display.c into the .c file already present and skip the next step.**
- ❑ Remove the file **DE_hello_world.c** by right clicking on the file and selecting **Delete**.
- ❑ Right click on the hello_world_sw in the Project Explorer and click on **Clean Project**.
- ❑ When the program is finished, right click on hello_world_sw again and select **Build Project**.
- ❑ Once the build completes, the **.elf** file under the hello_world_sw project should be updated. To check, right click on the **.elf** file and go to **Properties**. The time under the “Last Modified” section should reflect the time the last build was completed.
- ❑ Right-click on the **hello_world_sw** folder in the Project Explorer on the right and select **Run as → Run Nios II Hardware**. This will run the new C program on the NiosII processor.
- ❑ Now a prompt should appear in the console telling you to enter text. Type something like “Hello World” into the console and press **ENTER**. The text should appear on the seven-segment display.
- ❑ You can control the text in the following manner using the two push buttons:
 - Press KEY0 to perform multiple functions. The console outputs the current step.
 - Press to speed up (hold down to speed up more).
 - Press again to speed up more (hold down to speed up more).
 - Press again to go even faster (might go so fast all LEDs appear on).
 - Press again to slow down.
 - Press again to change scroll direction (to the right).
 - Press again to flip letters upside-down.
 - Press again to make the letters scroll up (or dance)
 - Press again to make the letters scroll down (or dance)
 - Press again, to clear screen
 - Press KEY1 change text. Look at the console for further instructions.

If you are fluent in C, try modifying the program to add functions for some of the other switches. When modifying, or writing your own program, the variable switch_datain is assigned the value of the switches.

LABSUMMARY

You now have completed the hardware and software sections of this lab. This includes:

- Loading the Device Kit pin settings into Quartus.
- Using Platform Designer to build a Nios II based system.
- Instantiating the Platform Designer component into your top level design.
- Add some connections between push buttons, switches and LEDs.
- Compiling your hardware.
- Importing the Nios II based system into the Eclipse Software Build Tools.
- Building a software project.
- Modifying a software template to perform some simple IO functions.
- Compiling your software.
- Downloading the hardware image into the development kit.
- Downloading the software executable into the development kits.
- Testing the hardware.

Revision History

DATE	NAME	DESCRIPTION
05/01/2015	L. Landis	Initial release
06/02/2015	L. Landis	Added BeMicro
11/30/2015	I. Rush	Added CVE DevKit
12/02/2015	S. Meer	Consolidated sections
12/04/2015	I. Rush	Updated pinout table
03/18/2016	K. Kita	Separated lab by board
05/10/2016	J. Xia	Revised for university workshops
06/06/2016	P. Mayer	Added scrolling text
03/23/2017	A. Weinstein	USB blaster installation
04/03/2017	A. Weinstein	Added CVGX DevKit
04/18/2017	A. Weinstein	Updated .qar files
10/23/2017	D. Henderson	Port to DE10-Lite
02/15/2018	A. Joshipura	Added location where to unzip files
03/21/2018	A. Joshipura	Added switch in the manual and changed figures for it; added SW2-LED2 connection
04/02/2018	A. Joshipura	Edited functionality of seven segment display to do all functions in button 0
04/08/2018	R. Nevin	Fixed switch PIO direction, clarified guidance for “hello world small” template & instructions to import DE10LITE_hello_world.c
04/11/2018	A. Joshipura	Added a single page for different workshop links; added images of both boards and changed Qsys to Platform Designer.
04/25/2018	A. Joshipura	Added Intel logo 7 explanation on the links
07/06/2018	S. Soto	Fixed System Done code by uncommenting line 88 (for DE10-Lite) and line 172 (for DE0-CV) in golden_top.v; fixed the order of components listed in the beginning of Lab 1.5 and emphasized double checking components were named properly
07/06/2018	H. Martinez	Edited seven segment screen code; cleaned up syntax and added console text for clarity
08/22/2018	H. Martinez	Transferred from .docx to \LaTeX ; updated figure numbers and enforced cross referencing; revised minor grammar issues; formatted according to Intel branding guidelines
08/08/2019	R. Nevin	Fixed incorrect URLs and product names
09/12/2019	R. Schutz	Edited to create short form lab. Made JTAG UART only component needing to be added
